

## El cambio de rines deportivos en el chevy

Por: Irving Cruz

Antes de decidirnos a cambiar los rines de nuestro chevy, primero debemos conocer algunos conceptos importantes.

El siguiente texto fue obtenido del artículo:

<http://www.terra.com.mx/Automovil/articulo/122200/>

Cambiar de rines no consiste sólo en quitarle los originales y ponerle los más grandes que le quepan a tu carro; por algo, los fabricantes dedican tanto tiempo a asegurarse de que las partes superen determinadas pruebas. Por ejemplo, unos rines inapropiados, que están “salidos” de la carrocería, provocarán que el coche “pise chueco”, y habrá mayor desgaste en la suspensión, y el manejo se alterará. Así que mejor no te “emociones” y busca consejo profesional.

## Medidas

**Diámetro.-** Es la circunferencia del rin medida desde donde asienta la llanta. Los más pequeños (comercialmente) son los de 13 pulgadas, usados en su mayoría en autos compactos. Los de 15" son de los más comunes, pero pueden llegar hasta 22. Es importante señalar que el diámetro exterior de la llanta debe conservarse similar, de lo contrario, se alteran las cualidades de manejo y la medición del velocímetro se trastorna. Por eso, entre más grande sea el rin más bajo debe ser el perfil de la llanta.

**Anchura.-** Van desde las 4 a las 14 o más pulgadas, y afectan drásticamente la manera en que la llanta pisa. Sin ser una regla, se recomienda que el ancho de la "cama", sea alrededor de 10% más angosta que la banda de rodamiento de la llanta. Un rin angosto ocasiona que sólo el centro de la huella pise con firmeza, mientras que uno demasiado ancho fomenta que sean sólo las orillas de la huella las que hacen contacto. Además, tienden a permitir que la llanta se despegue de éste al exigirle demasiada tracción lateral en curvas cerradas.

**Offset.-** Es la distancia que existe entre el centro de la cama, y el plano donde se atornilla al disco o tambor de frenos. Un rin con offset negativo es aquel en el que la llanta se sale del centro; mientras que en uno positivo el neumático "se mete". El offset afecta drásticamente la geometría de la suspensión, y por lo tanto el manejo. Se recurre a un offset negativo cuando la cara de la llanta roza con algún elemento de la suspensión. Pero se debe ser muy conservador al modificarlo, porque al hacerlo se castigan otros elementos de la suspensión, reduciendo su durabilidad, y propiciando que surjan fallas.

**Altura de pestaña.-** Es el borde del rin en el cual asienta la llanta. El código más común es J, mientras que los neumáticos de perfil muy bajo suelen emplear las medidas JJ o JK, que son de menor longitud.

Una vez entendidos los conceptos anteriores pasemos a analizar los mejores valores para nuestro chevy.

El siguiente texto fue modificado a partir del original obtenido de la revista de Chevymanía # 45 en la sección de preguntas y respuestas, aportación de Miguel Angel Borquez Estrada.

Si revisamos el rin 13" original de nuestro chevy (se revisó en un chevy Pop 2001) vemos que tiene grabado los siguientes números entre otros:

**13x5  
ET 49**

Por lo que se deduce que es de 13 pulgadas de alto x 5 de ancho y un offset de +49 milímetros (mm). Es probable que exista un poco de confusión sobre la forma de tomar la medida del offset y para darse cuenta de que mientras más grande sea el offset, más metido estará el rin. Para ello hagan referencia a la siguiente figura (imagen tomada y traducida de <http://www.whalentine.com/faqs.cfm> )

This represents a side cutaway view of a wheel to help explain how offset is measured.

Offset is the measurement of the distance from the centerline of the wheel to the mounting surface. As offset gets higher the wheel will move further back under the fender of the vehicle.

Esto representa una vista lateral recortada de un rin para ayudarnos a explicar como es medido el offset

El offset es la medida de la distancia desde la línea central del rin a la superficie de montaje. Mientras más grande sea el offset, el rin se moverá mas atrás de la salpicadera.

Luego entonces, el rin mas parecido al original puede ser un rin de 15 pulgadas con medidas 15 x6.5 y ET de +45.

Haciendo algunos cálculos tenemos:

El rin tiene 6.5" de ancho, entonces el centro del rin está ubicado en 3.25 " de allí se miden los 45 mm hasta la superficie de montaje. Sabiendo que 1 pulgada = 2.54 cm, tenemos entonces que el rin tiene un ancho de  $6.5 \times 2.54 = 16.51 \text{ cm}$ . por tanto el centro estará a la mitad: **8.255cm.** , sumándole los 4.5 cm del offset, la superficie de montaje estará entonces a  $8.255+4.5 = 12.755 \text{ cm}$  . Si al ancho total le restamos esta última cifra obtenemos la media del rin que le sobra después de la línea de montaje.  $16.51 - 12.755 = 3.755 \text{ cm}$ .

Haciendo estos mismos cálculos para nuestro rin original tendremos que:

Ancho:  $5 \times 2.54 = 12.7 \text{ cm}$

Línea de montaje:  $6.35 + 4.9 = 11.25 \text{ cm}$

Distancia del rin después de la línea de montaje:  $12.7 - 11.25 = 1.45 \text{ cm}$ . (esta medida la usaremos para calcular cualquier otro rin)

Finalmente si restamos las distancias que sobran a partir de la línea de montaje:  $3.755 - 1.45 \text{ cm} = 2.305 \text{ cm}$ . Esto nos indica que el nuevo rin de 15x6.5 con ET +45 estará 2.305 cm. salido tomando como referencia el rin original. 🤖

Todas estas medidas son bastante importantes de considerar, ya que el chevy tiene un detalle, si no se hacen bien los cálculos, la parte frontal o posterior va a rozar. Si se utiliza por ejemplo un rin 15x7 ET +35 nos metemos en grandes problemas, pues haciendo estos cálculos obtendremos que el borde extremo del rin se encontrara 3.94 cm afuera del lugar original. Por eso, tanto el ancho como el offset del rin son muy importantes.

Estas operaciones también son validas para rines de mayor diámetro.

## Algunos otros cálculos de rines comerciales:

### Rines 15x6.5 offset 40

Ancho: 16.51

Línea de montaje:  $8.255 + 4 = 12.255$

Distancia salida de la original:  $16.51 - 12.255 = 4.255 \text{ cm} - 1.45 = 2.805 \text{ cm. salido}$

### Rines 16 x 7 offset 43

Ancho: 17.78

Línea de montaje:  $8.89 + 4.3 = 13.19$

Distancia salida de la original:  $17.78 - 13.19 = 4.59 \text{ cm} - 1.45 = 3.14 \text{ cm. salido}$

### **Rines 17 x 7 offset 35**

Ancho: 17.78

Línea de montaje:  $8.89 + 3.5 = 12.39$

Distancia salida de la original:  $17.78 - 12.39 = 5.39 \text{ cm.} - 1.45 = \mathbf{3.94 \text{ cm salido}}$

### **Rines 17 x 7 offset 40**

Ancho: 17.78

Línea de montaje:  $8.89 + 4 = 12.89$

Distancia salida de la original:  $17.78 - 12.89 = 4.89 \text{ cm} - 1.45 = \mathbf{3.44 \text{ cm salido}}$

### **Rines 17x7 offset 42**

Ancho: 17.78

Línea de montaje:  $8.89 + 4.2 = 13.09$

Distancia salida de la original:  $17.78 - 13.09 = 4.69 \text{ cm.} - 1.45 = \mathbf{3.24 \text{ cm. salido}}$

## **LLANTAS**

Las llantas más comunes para el chevy dependiendo del rin deportivo que le pongamos son:

Para rin 13: 205/60/r13

Para rin 15: 195/50/r15

Para rin 16: 205/40/r16 ó 195/50/r16

Para rin 17: 205/40/r17

Para rin 18: 215/35/r18

Recomendable leer el artículo sobre llantas en: <http://vauxhallclub.com.mx/taller/llantas.htm>

## **PESO DEL RIN**

Se debe considerar que muchas veces, rines grandes significa rines más pesados, esto es importante ya que el mayor peso de los rines puede afectar en mayor grado la suspensión del auto y el desempeño del coche en curvas. (Obtenido de Mundomini.com). El peso promedio de los rines deportivos ronda como muestra la siguiente lista:

17" promedio 19.8 lb. = 8.981 Kg.

18" promedio 25.0 lb. = 11.34 Kg.

20" promedio 40 lb. = 18.144 Kg.

Una lista bastante extensa de rines comerciales se encuentra al final del documento como Anexo.

## **SOBRE LA VIBRACIÓN**

Para elaborar siguiente texto se tomó como base el artículo del Vauxhall Club México:

<http://vauxhallclub.com.mx/taller/vibra.htm>

La vibración de la dirección por cambio de rines es muy común en el chevy, sobre todo cuando se usan rines de mala calidad, recuerden que lo barato sale caro.

Para eliminar la vibración hay que considerar lo siguiente:

- 1.- Descartar fallas en el sistema de dirección
- 2.- Los rines no deben estar doblados ni maltratados.
- 3.- Usar centradores.
- 4.- Buen balanceo
- 5.- Utilizar birlos más grandes y con centro cónico.

### **Fallas en la dirección**

Dentro de las piezas de la dirección más comunes que se dañan y hacen que se presente la vibración están las rótulas, terminales de dirección, baleros, hidrobush, baleros del amortiguador, bases del amortiguador, resortes.

### **Rines doblados y maltratados**

Muchas veces oímos decir a nuestros amigos que su auto esta presentando vibración en el volante cuando no lo hacia, esto se debe a que lo rines se ovalan al pasar el tiempo por el uso y las grandes irregularidades del pavimento en nuestro país. En ocasiones pasamos un bache y nunca nos imaginamos que éste provocó un doblez ligero en el rin delantero; nos percatamos de esto después cuando imprimimos velocidades superiores a los 80Kms /hr o antes en el peor de los casos. Por ello es importante establecer una revisión del estado de nuestros rines e irlos rotando por lo menos cada 15,000 kms al mismo tiempo que le hagamos alineación y balanceo y sí es necesario mandarlos a enderezar.

### **Centradores**

En la mayoría de los casos (no solo en el chevy), se requieren centradores (algunos los llaman “aumentos”) ya que el rin cuenta con un centro demasiado grande para la masa del disco, es por esto que se incluye un centrador (uno por rin) a fin de llenar este espacio del rin. Los hay de varios materiales como lo son acero, plástico y aluminio, este último es el más adecuado por su peso y resistencia.

Centradores (izquierda de plástico, derecha aluminio)

Los centradores no son universales, existen infinidad de medidas y para saber cual es el correcto para nuestro auto, debemos conocer el “hub bore” (diámetro de la masa) del rin. En el caso del chevy el rin original tiene un “hub bore” de 56.5 mm. Ahora nos resta conocer el “hub bore” del rin deportivo que queremos comprar, en mi caso fueron unos rines ADR, los cuales el fabricante especifica que tienen un “hub bore” de 73 mm, por lo tanto necesité conseguir centradores de la medida: **diametro interior 56.5 mm y diamtero exterior 73 mm.**

La forma de colocar estos se ilustra a continuación:

Se pueden colocar en el rin

O bien en la masa, el resultado es el mismo.

Imágenes obtenidas de: <http://www.wildweasel.ca/j-body/HowTo/wheelinstall.asp>

En ocasiones es muy difícil encontrar los centradores correctos para nuestro rin, pero estos se pueden mandar a hacer a taller de “torno y soldadura” donde los hacen a la medida 😊 y en aluminio, con un costo aproximado de 100 pesos por centrador, casi lo mismo que te salen un de marca comercial.

## **Birlos**

Los birlos también juegan un papel importante en esta modificación ya que serán los encargados de establecer el centrado óptimo y son pareja inseparable de los centradores. Existen unos birlos que cuentan con un aumento cónico para centrar de manera exacta el rin. Cabe mencionar que estos birlos solo se recomiendan adelante, los posteriores deben ser de tamaño estándar para evitar fricciones con el sistema de frenado.

Aunque en la parte posterior pueden ser usados birlos de la misma medida, para comprobar que no hay fricción con el sistema de frenado, al momento de estar instalando un rin en la parte de atrás hay que darle vuelta a la llanta y escuchar con atención si no existe un golpeteo o rozamiento con la balata, si lo hubiera solo hay que recortar un poco el birlo hasta solucionar el problema.

La medida mas común de birlos para el chevy que se puede encontrar es de 12 x 1.5. Y la forma es más o menos como la de la figura siguiente (noten la cabeza con el aumento cónico).

Un aspecto importante a considerar es también el ancho de la cabeza del birlo, ya que muchas veces los rines traen el orificio para los birlos muy pequeños, por lo tanto si pensabas ponerle los originales del auto posiblemente no entrarán, este aspecto es muy común en aquellos rines que traen doble barrenación (es decir 8 orificios en el caso del chevy, ya que los otros 4 son para otra medida de auto).

Recordemos también incluir birlos de seguridad por aquellas personas amantes de lo ajeno, marcas recomendadas por muchos son: Gorilla y Rino, que vienen en paquete de 4 con una llave única.

### **Importante al apretar los birlos:**

- Los birlos en los rines deportivos se deben de apretar con llave de cruz, no con pistola, esto para evitar barrerlos al darles con demasiada fuerza con la pistola o que sea mas propensa la vibración al ser la presión diferente en los 4 birlos que sujetan al rin.

- También es recomendable no poner todos los birlos(16) de tipo de seguridad, ya que estos no se deben de apretar con mucha fuerza porque son de un torque menor y se pueden barrer, solo uno por rin y deben ser apretados con menos fuerza que los otros.

## **Balanceo**

Muchas ocasiones los servicios "especializados" no conocen la manera de balancear un rin deportivo, donde influyen factores como el ancho, el plano, la distancia y la rodada. Todos estos datos deben introducirse en la computadora de balanceo para obtener el valor absoluto de peso con que debe contar el plomo que se añada (se recomiendan plomos de uña y poco los adhesivos). Es recomendable balancear el rin con el centrador puesto.

Aquí es importante señalar que un rin de buena calidad debe de poder ser balanceado por computadora sin problemas.

En los rines de baja calidad muchas veces aunque se balancee por computadora presentan vibración, debido a que no están debidamente calibrados. Pero se puede reducir en gran medida si se siguen los consejos de usar centradores, birlos y además un **balanceo dinámico**.

Un balanceo dinámico es balancear las llantas delanteras con el rin montado en el auto, encendido el auto y acelerando para hacer girar solo la llanta que queremos balancear, así los técnicos aumentarán y quitarán plomo de acuerdo a la vibración que se presente en el volante al acelerar.

Balanceo x computadora

Balanceo dinámico

## **Suspensión**

Para elaborar siguiente texto se tomó como base el artículo del Vauxhall Club México:

<http://vauxhallclub.com.mx/taller/rines.htm>

Al cambiar la medida de rines, se tiene que reforzar el sistema de suspensión para no dañar partes de la misma, aquí las recomendaciones:

Si pones un rin 15 con llanta 195/50/15 (por lo general es 50) sólo hay que invertir en un par de amortiguadores de gas presurizado (recomendamos Lip, Monroe, Boge) para que la carrera del amortiguador sea más firme y estática (esto puede endurecer más la suspensión de tu Chevy). En si se elige un rin 16" se tendrá que agregar un par de resortes reforzados o más gruesos.

Para la elección de rin 17" se tendrá que invertir por fuerza mucho más dinero, ya que se tendrá que incluir un kit de 4 resortes reforzados (existen marcas como eibach, vogtland, sparco, AG) y amortiguadores de gas, o mejor aún adelante 2 "struts" de gas (marcas como tokiko o bilstein) acompañados de los 2 amortiguadores traseros (marcas como tokiko o bilstein).

Hasta aquí llega mi aportación sobre el tema del cambio de rines, esperando les sea de utilidad.
